MSS: added value

Several factors in an individual's occupational and/or private environment can lead to high strain and an elevated stress level. These factors tend to reinforce each other – a vicious circle which may, in the end, result in the complete loss of the ability to work. Stressors often cannot be eliminated from the job completely. However, one can learn how to deal with pressure and stress, and how to handle demanding situations positively by the implementation of MSS! The MSS tool can be perfectly combined with DNLA Social Competence analysis. The combination of the two tools leads to a holistic view of the current situation, and the identification of interrelations between the various factors.

Fit for the job, and for life's challenges
